E - NOTE SYSTEM(MOBILE APPLICATION)

SUPERVISOR
PN NORSYARIZAINI BT A.MUTOLIB

PRODUCT DESCRIPTION

The system for user to write the note. User also can upload their PDF file to the system. Beside that system also provide the tools for user drawing the note. This application also secure because before use must login and for first user must register first .

PROBLEM & CAUSES

1. Most e-Note application doesn't need a account to access the system
2. The e-Note application doesn't provide some tools for user edit with free use .
3. Most application don't give sharing by global PDF
4. Most application not easy way to give the user to forget password if user was forget their password to login their account

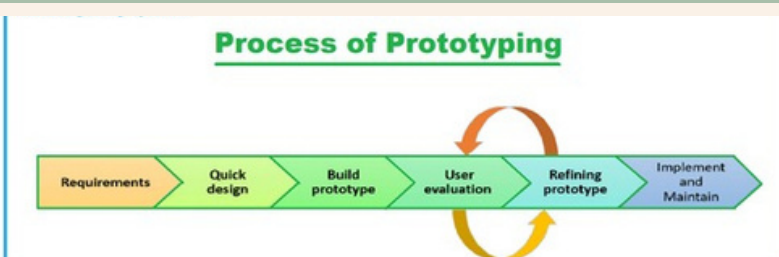

OBJECTIVE

- 1.Build the e-Note application that enable user to create and edit their notepad by text.
- 2.Provide the edit tools like color pencil ,paint , brush, highlight, and eraser for user to editing the pdf file.
- 3.Provide the function for user register a account before they access the e-Note application .

CONCLUSION

The e-Note application not only allows users to open and edit PDF files, but also provides enhanced security features for login and authentication. With robust security measures in place, users can securely access their notes and ensure the privacy and confidentiality of their information. This login security feature adds an extra layer of protection to prevent unauthorized access to the user's files and maintain data integrity. By combining the convenience of note-taking and the assurance of a secure login, e-Note offers users a comprehensive solution for efficient and secure note-taking and storage.

METHODOLOGY & MATERIALS

Requirement gathering and analysis

The requirements of the system are defined in detail. During this process, users of the system are searching for information online to learn what they expect from the system.

Quick Design

The simple system is be developed to gives a brief idea of our application Note BSK to help us to develop the system. It gives a brief idea of the E-note system to the user and helps developing the prototype.

Build a prototype

An actual prototype is designed based on the information gathered from quick design. The Note BSK is developed based on the information in the quick design. The user interface and the button for upload, edit and download is showing and can function effectively.

User evaluation

The requirements of the system are defined in detail. During this process, users of the system are searching for information online to learn what they expect from the system. Note BSK is presented for the student first to make initial evaluation. After that, the feedback and suggestion from student will be collected. This will help to improve the E-Note application system.

Refining prototype

The prototype will make refine according to the user feedback and suggestions. This might involve adding new features, refining, or addressing any issues identified during the user evaluation phase.

Implementation system and Maintenance

Once the final the eNote application system is developed based on the final prototype. After that the system will tested and deployed to production. Lastly the system will make maintenance to prevent the error happening.
